Environmental and Energy Policy

Amprion GmbH operates one of the largest electricity transmission grids in Germany. We guarantee all customers non-discriminatory grid access and safe, economical, and efficient electricity transmission. We are paving the way for a climate-neutral energy system by expanding our grid in accordance with our statutory mandate. In this way, we help integrate renewable energy into the system and transport it to load centers.

We are committed to protecting the environment and acting in an energy-efficient manner. Our goal is to minimize the impact of our business activities on people and the environment as much as possible. To this end, we reduce energy consumption and increase energy efficiency. To meet these requirements through internal structures and processes, Amprion operates an integrated environmental and energy management system certified to DIN EN ISO 14001 and DIN EN ISO 50001.

The following principles form the basis of our environmentally and energy-conscious actions:

- Compliance with applicable legal and regulatory obligations forms the foundation of our work.
- The construction and operation of grid infrastructure result in energy consumption and greenhouse gas emissions. By further developing the grid infrastructure while taking technical and local constraints into account, we minimize these emissions as much as possible and thereby contribute to environmental and climate protection.
- We carry out projects to improve nature and species conservation and take into account the protection of water, soil, and air.
- We are committed to conserving resources and promoting a circular economy by avoiding waste whenever possible and prioritizing reuse and recycling throughout our value chain.
- We are committed to the continuous improvement of our environmental and energy management system. To enhance our energy and environmental performance, we define appropriate goals and measures. We regularly monitor, measure, and evaluate our environmental and energy performance using appropriate metrics.
- We report regularly and transparently to internal and external stakeholders on our environmental goals, measures, progress, and environmental performance.
- We maintain a regular and open dialogue with our stakeholders to incorporate their expectations and feedback into our environmental decisions and measures. In doing so, we promote transparency and strengthen trust in our actions.
- We expect a high level of environmental awareness from our service providers and suppliers and work toward the implementation of environmental and energy standards. The technical specification and procurement of our products are based, among other things, on environmental and energy-related criteria.

Environmentale conscious and energy-efficient practices are based not only on internal structures and processes but also on the knowledge and commitment of our employees. Therefore, through information, training, and education, we promote environmentally conscious and energy-efficient practices and empower our employees to actively contribute to the continuous improvement of our environmental and energy performance.
